

Auxiliom continues focusing on its cognitive decision-making platform, while Toolbox maintains its modular automation tools. Their partnership allows shared clients to benefit from both systems working together while keeping each company independent and innovative.

The collaboration enables businesses to choose either platform separately or use them combined. This flexible approach prevents vendor lock-in and promotes healthy competition in the AI market. Both companies will maintain open APIs to ensure compatibility with other systems.

Industry observers note this partnership model offers an alternative to the industry trend of consolidation and acquisition. By working together while remaining separate, Auxiliom and Toolbox can provide integrated solutions without creating another monolithic AI provider.
